

SA River Murray Flow Report

Report #49/2024

Issued 12:00 pm 6 December 2024

This supersedes the previous Flow Report issued by the Department for Environment and Water (DEW) on 29 November 2024. The next Flow Report will be provided on Friday 13 December 2024.

Flow outlook

The flow at the South Australian border is approximately 14 GL/day and is expected to decrease to approximately 12 GL/day by next Friday, **depending on river operations**.

The current flow at the South Australian border includes the full December Entitlement Flow (7 GL/day), along with water for the environment, interstate trade adjustments and adjustment for deferred entitlement flows, which are stored and accumulated for critical human water needs during dry periods.

The current flow over Lock 1 is approximately 13.5 GL/day, but it is expected to decrease to 13 GL/day by next Friday. It is important to note that flow forecasts in this advice are based on the information available at the time of preparation. Advice may change as new gauging information becomes available or due to rainfall events or changed operations upstream.

Water levels

Current water levels are updated daily and can be found on [WaterConnect](#).

Upstream flows

In December, flows at the South Australian border are expected to continue to decrease as environmental water releases throughout the system continue to decline. Flow forecasts remain subject to change, depending on river operations and catchment rainfall. More information on upstream conditions and forecasts can be found in the [Murray-Darling Basin Authority's Weekly Flow Report](#).

Water for the environment delivery

The draw down of the low-level operation of the environmental regulators at the Pike and Katarapko Floodplains is continuing with the water level being gradually lowered back to the normal operating level. Pumping is continuing at one site higher on the floodplain at Pike to water regenerating lignum and black box and to provide habitat for birds and frogs.

Water for the environment is also currently being delivered via pumping to sites on the Chowilla Floodplain.

The floodplain environmental watering actions are aimed at supporting the significant improvements in condition and regeneration of trees, lignum and understorey vegetation and providing important habitat for frogs, waterbirds and other fauna.

Water for the environment continues to be delivered as part of SA's Entitlement flow. In addition, water for the environment is being delivered at the border from releases in the Murray and the Murrumbidgee rivers as part of the spring pulse. Although flow is currently around 14,000 ML/day and remaining in channel, the spring pulse is expected to support Murray cod and golden perch breeding, increased river productivity and provide benefits to the Lower Lakes and Coorong. Similar spring flows in 2019 were

followed by a significant Murray Cod recruitment event. Environmental water will continue to arrive over the next 1 to 2 weeks from releases in the Murray and Murrumbidgee. The upstream releases have recently ceased and flow to South Australia will gradually recede. In the absence of water for the environment, SA would currently be receiving Entitlement flow only (7,000 ML/day in December).

Murray Mouth

Dredging operations at the Murray Mouth continue. Dredging is undertaken to maintain connectivity (exchange of water) between the Coorong and the Southern Ocean.

Dredging operations have continued on the Tauwichee channel, with plans to reposition the dredge closer to the mouth. This work has further improved the flow between the Tauwichee and Goolwa channels and the mouth. Dredging operations may be impacted by severe weather, significant swell and dredge maintenance activities.

Barrage releases, combined with dredging, help to maintain flow connectivity of the River Murray Channel to the Murray Mouth and assist in exporting salt from the river system.

Exclusion Zones established around the dredging operations are in place to ensure public safety. Refer to [Notice to Mariners No 61 of 2023](#).

Barrage operations and water levels in the Lower Lakes

The water level in Lake Alexandrina is approximately 0.84m AHD and Lake Albert is approximately 0.85m AHD.

The Lower Lakes are being managed to target a daily average lake level between 0.75m AHD and 0.85m AHD throughout December.

During adverse weather conditions and high tides, SA Water will operate the barrages to minimise the risk of seawater entering Lake Alexandrina, therefore minimising any negative salinity impacts from reverse flow events. Barrage operations will continue to be undertaken dependent on upstream flows, lake levels and variable weather conditions.

Gate openings at the barrages can now be viewed on [Water Data SA – Barrage dashboard](#).

Total daily flow releases from the barrages can also be found on [Water Data SA – Flows dashboard](#).

Water quality

Algal blooms upstream of SA

Numerous amber alerts for Blue Green Algae remain upstream of the Border. An amber alert indicates that the water should be considered unsuitable for potable use and that the water may be unsuitable for stock watering. Water users should use caution and avoid water where signs of Blue Green Algae are present. Details of the current alert locations can be found on the [WaterNSW website – Algae Alerts page](#).

River Murray Vessel Waste Disposal Stations

The Lock 3 River Vessel Waste Disposal Station has been out of commission since January 2020 due to a significant infrastructure failure. The nearest alternative waste facility is located at Waikerie. Normal boat hard waste (domestic or galley waste) can still be deposited at the Lock 3 facility at the present time.

You can report any River Vessel Waste Disposal Station issues on 1800 799 065.

If you have any questions, please contact the DEW WIO Engagement Team on DEW.WIOCommunications@sa.gov.au

Salinity

Salinity levels throughout the River Murray in South Australia are within their typical range. Nonetheless, it is possible that some irrigators may record higher salinity readings at isolated locations. These higher readings are more likely to be observed at the bottom of the water column.

Irrigators are encouraged to monitor the [daily salinity levels](#) provided by SA Water as part of their business operations.

Intermediate remediation of the LMRIA levees project

The Intermediate Remediation of the LMRIA Levees project is jointly funded by the Australian and South Australian governments, through the Disaster Recovery Funding Arrangements. This project will return the flood damaged sections of government and private levees to their pre-flood height.

Intermediate remediation works update:

- On ground works have been completed at Pompoota and Long Flat.
- On ground works continue to progress at Mypolonga and Wall Flat.
- The Department for Environment and Water (DEW) is working with the Department for Infrastructure and Transport (DIT), as the state infrastructure agency, on the procurement of contractors to undertake works.
- The DIT tender process for the remaining 4 government levee banks is complete and an award announcement is imminent.
- The procurement for works on private levees and the preparation of associated land access agreements are progressing.
- On-ground geotechnical investigations for the condition assessment of LMRIA levees are complete. The results will continue to be analysed over the coming weeks with final reporting expected to be provided to the department once this has concluded.

Public access to levees

Where intermediate remediation works are required for government levees, they will remain closed until the works are progressively completed and safe access is determined over the next 6-9 months. Any government levee not requiring intermediate remediation work will remain closed pending the outcome of a full condition assessment and a safety risk assessment to ensure they are safe for public access.

The government levee banks are Cowirra, Neeta, Wall Flat, Pompoota, Mypolonga, Mobilong, Burdett, Long Flat, Monteith and Jervois. Access to private levees is at the landholder's discretion, however, access is not permitted where remediation works are being undertaken.

The safety of the public is of paramount importance and DEW will keep the community informed of the project's progress, including when levees may be accessible to the public, through its website and newsletter.

For more information, please visit [Department for Environment and Water – Levees](#)

If you have any questions, please contact Lisa van der Linde, Communications and Engagement Officer on 0437 313 087 or Lisa.vanderlinde@sa.gov.au

Environmental News – Shrimply amazing!

Large numbers of shield shrimp (*Troips australiensis*) were recently recorded at Lake Littra, on the Chowilla Floodplain. Shield shrimp are an ancient native crustacean found in temporary wetlands and pools. They can have up to 60 legs which they use not only to propel themselves through water, but also to breathe! Their eggs can lay dormant in the dry sand for years until a watering or rainfall event. These fascinating creatures have emerged in response to the recent delivery of water for the environment to some of Chowilla's ephemeral wetlands.

DEW ecologists also recorded high numbers of freshwater glass shrimp (*Paratya australiensis*), brine shrimp (*Parartenia sp.*), mussel larvae, and several species of water beetle. These macroinvertebrates play a vital role in the productivity of a wetland, providing food recourses for native fish and waterbird species.
