

# SA River Murray Flow Report

Report #09/2026

Issued 12:00pm 27 February 2026

This supersedes the previous Flow Report issued by the Department for Environment and Water (DEW) on 20 February 2026. The next Flow Report will be provided on Friday 6 March 2026.

## Flow outlook

The flow at the South Australian border this Friday is approximately 7.5 GL/day and is forecast to remain at approximately 7.5 GL/day to next Friday.

The current flow at the South Australian border includes February Entitlement Flow (7 GL/day), which is adjusted for deferred entitlement volume that is stored and accumulated for critical human water needs and private carryover during dry periods.

The flow over Lock 1 this Friday is approximately 7.0 GL/day and is expected to reduce to approximately 6.0 GL/day by next Friday.

It is important to note that flow forecasts in this advice are based on the information available at the time of preparation. Advice may change as new gauging information becomes available or due to rainfall events or changed operations upstream.

## Water levels

Current water levels are updated daily and can be found on [WaterConnect](#).

## Upstream flows, rainfall and storages

Rainfall was widespread over the southern and central Murray-Darling Basin over the past 7 days to 25 February 2026, with the northern Basin recording little to no rainfall over this period.

Southern Queensland, along the western boundary of the Basin, recorded up to 25mm of rain. New South Wales received widespread rain, with totals of up to 50mm in the west and up to 25mm in the east. Central New South Wales recorded lower rainfall of up to 5mm, with isolated patches recording no rain.

Victoria and South Australia also received widespread rainfall. Totals of up to 25mm were received across much of Victoria, with higher rainfall totals of 100mm in the east. South Australia recorded rainfall totals between 1 and 25mm, with the highest rainfall recorded in the north. Further rainfall information for the Basin can be found at <http://www.bom.gov.au/climate/maps/rainfall/>

As of 26 February 2026, Dartmouth Dam storage has reduced to 2,584 GL, approximately 67% of capacity, and Hume Dam storage has increased slightly to 765 GL, remaining around 25% of capacity. Storage in the Menindee Lakes continues to decrease and is at 685 GL or approximately 40% of capacity. As of 23 February 2026, combined releases from Menindee Lakes are approximately 1.3 GL/day.

Lake Victoria storage has decreased to 302 GL, approximately 45% capacity, which is a reduction of approximately 22 GL over the past 7 days. Releases from Lake Victoria are currently contributing to approximately 10% of the flow to South Australia.

Flows at the South Australia border averaged approximately 8.5 GL/day over the past week.

This forecast remains subject to change, depending on river operations and catchment rainfall. More information on upstream conditions and forecasts can be found in the [Murray-Darling Basin Authority's Weekly Flow Report](#).

## Water quality

### Water quality upstream of SA

Please be advised that with additional flows coming from the Darling River there will be an increase in turbidity of the water in the main channel of the River Murray. Horticulturalists may consider this as part of filtration and backflush programs for irrigation systems.

### Algal blooms within SA

#### Coorong

Government agencies continue to work together to conduct fortnightly water testing in the Coorong to monitor for *Karenia*.

For algal bloom water testing results and further information visit [Algal Bloom Water Sampling Dashboard](#).

For Coorong North Lagoon water quality and environmental conditions visit [Coorong North Lagoon Conditions Dashboard](#).

The Coorong region remains open. Visitors are advised to check signage and avoid contact with discoloured water, foamy water, or water where marine life is dead or in poor health. When the algae are broken up by wave action, algal particles can cause short-term skin or eye irritation and respiratory symptoms, including a cough or shortness of breath. If you notice symptoms, move away from the beach or water. Most symptoms will resolve within hours of leaving the area.

From time to time, depending on weather conditions, strong winds and wave action may cause people living near affected beaches to experience eye, skin or respiratory symptoms while at home. If this happens, stay indoors with windows closed until conditions change or symptoms resolve. Some people may find using an air purifier to be helpful.

#### *Health advice for people with asthma*

Some algal species can release biotoxins (specifically brevetoxins) into the air through wave action. Exposure to aerosols containing algal particles or brevetoxin may trigger symptoms in people with asthma.

People with asthma are advised to:

- carry their reliever medication with them while on beaches, especially when there is thick, visible foam or discoloured water
- take their preventive medication as prescribed
- check their asthma management plan is up-to-date.

People with known asthma, emphysema, bronchitis, or other form of chronic lung disease may be more vulnerable to the respiratory effects of biotoxins and should avoid areas where there is discoloured or foamy water, particularly if there is an onshore breeze.

International evidence indicates there are no long-term health consequences of exposure at the beach to either algal particles or biotoxins.

If symptoms persist, seek medical advice from your doctor.

For further information visit the [SA Health – Water quality alerts](#) page.

For the latest information please visit the SA Government [algal bloom](#) page.

### Algal blooms upstream of SA

WaterNSW issues blue-green algae (BGA) alerts as Red, Amber or Green. A red alert indicates a toxic algal bloom, making the water dangerous for humans and animals; an amber alert indicates BGA may be multiplying in numbers and water should be considered unsuitable for human or animal consumption but remains suitable for recreational use; and a green alert indicates the presence of BGA but not at levels to pose a threat to recreational, stock or domestic use.

WaterNSW has issued red alerts for Lake Menindee and Silver City Highway. The Edward Wakool system also has multiple amber and green alerts in place. Numerous BGA amber and green alerts apply to the River Murray between Lake Hume and the SA border, and additional alerts are current across the Menindee Lakes and the lower Darling. Further details of the current NSW alert locations can be found on the [WaterNSW website – Algae Alerts page](#).

Victoria's Goulburn-Murray Water has issued recreational BGA warnings for Tullaroop Reservoir, Hepburns Lagoon and Gum Lagoon in the Torrumbarry Irrigation Area. Details of the current VIC alert locations can be found on the [Blue-Green Algae Warnings - Goulburn Murray Water](#) page.

Lower Murray Water (LMW) advises there are no current red alerts for BGA. However, various low to mid-level recreational BGA alerts remain current on the River Murray from Boundary Bend through to Lock 9. Details of LMW alert locations can be found on the [Blue-green algae monitoring - Lower Murray Water](#) page.

## Water for the environment delivery

The delivery of water for the environment to the South Australian border is continuing at approximately 1.5 GL/day. This is a combination of direct trade to SA from the Commonwealth Environmental Water Holder and The Living Murray. The water being delivered is helping to manage Lower Lakes levels and provide a small volume of continuous flow to the Coorong. Water for the environment also continues to be delivered as part of SA's Entitlement flow.

Planning for further delivery of water for the environment throughout 2025-26 is continuing.

## Murray Mouth

Dredging is continuing directly in the Murray Mouth at the junction of the Tauwitche and Goolwa Channels.

Barrage releases, combined with dredging throughout most of the year, help to maintain flow connectivity of the River Murray Channel to the Murray Mouth and assist in exporting salt from the river system.

Exclusion Zones established around the dredging operations are in place to ensure public safety. Refer to [Notice to Mariners No 61 of 2023](#).

## Barrage operations and water levels in the Lower Lakes

As of 26 February 2026, the water level in Lake Alexandrina is approximately 0.65m AHD and Lake Albert is approximately 0.50m AHD, noting that lake levels can fluctuate considerably depending on wind conditions.

The Lower Lakes are managed, as far as practicable, to target a daily average lake level between 0.65m AHD and 0.75m AHD throughout February.

Barrage gate operations are adjusted to release water when tidal conditions permit and are dependent on upstream flows, lake levels and variable weather conditions.

Since mid-December 2025, barrage flows have been limited to fishways only. On 6 February 2026, a modified attractant gate at Boundary Creek barrage was also opened to help freshen important estuarine habitat within the Murray Mouth area. These small volumes of water for the environment have been provided specifically to support refuge habitat for the Coorong's invertebrates, waterbirds and fish. On 24 February 2026, the automatic gate on Goolwa barrage was opened to create localised 'salt wedge' conditions downstream of the barrage. This barrage bay will remain open for at least 28 days to support black bream recruitment.

Gate openings at the barrages can now be viewed on [Water Data SA – Barrage dashboard](#).

Total daily flow releases from the barrages can also be found on [Water Data SA – Flows dashboard](#).

## River Murray vessel waste disposal stations

The Lock 3 River Vessel Waste Disposal Station (RVWDS) has been out of commission since January 2020 due to a significant infrastructure failure. The nearest alternative waste facility is located at Waikerie. Normal boat hard waste (domestic or galley waste) can still be deposited at the Lock 3 facility at the present time.

Contractors will perform system upgrades at the following RVWDS on the dates listed below:

- Walker Flat RVWDS: 9 to 14 March
- Swan Reach RVWDS: 9 to 14 March
- Mannum RVWDS: 15 to 19 March.

The stations will remain operational; however, minor delays may occur.

For a full list and map of the stations visit: <http://environment.sa.gov.au/waste-disposal-stations>

You can report any River Vessel Waste Disposal Station issues on 1800 799 065.

If you have any questions, please contact the DEW WIO Engagement Team on [DEW.WIOCommunications@sa.gov.au](mailto:DEW.WIOCommunications@sa.gov.au)

## Salinity

Salinity levels throughout the River Murray in South Australia are within their typical range. Nonetheless, it is possible that some irrigators may record higher salinity readings at isolated locations. These higher readings are more likely to be observed at the bottom of the water column.

Salinity throughout the Goolwa Channel from the Goolwa Barrage to Clayton Bay remains elevated as a result of salt water ingress from recent storm surge events.

Irrigators are encouraged to monitor the [daily salinity levels](#) provided by SA Water as part of their business operations.

## Intermediate remediation of the LMRIA levees project

The Intermediate Remediation of the LMRIA Levees project is jointly funded by the Australian and South Australian governments, through the Disaster Recovery Funding Arrangements. This project will return the severely flood damaged sections of government and private levees to their pre-flood height.

Intermediate remediation works update:

- On-ground remediation works have been completed at Pompoota, Long Flat, Wall Flat, Mypolonga, Burdett, Mobilong and Placid.
- Construction works at Cowirra and Toora are continuing to progress. The substantive on-ground works at Neeta have been completed with final project close-out activities underway.
- The Department for Environment and Water (DEW) is working with the Department for Infrastructure and Transport (DIT), as the state infrastructure agency, on the procurement of contractors to undertake works on the remaining private levees that were severely damaged during the 2022-23 River Murray flood. The request for tender issued by DIT has closed and submissions have been assessed with approval processes currently underway.

### Government levees in the LMRIA are temporarily closed to the public.

Where intermediate remediation works are required for government levees, they will remain temporarily closed until the works are completed. Following the completion of intermediate works, all government levees will remain temporarily closed pending public safety risk assessments, tree assessments (and any arborist works required), fencing repairs and reinstallation of signage to ensure safe access before reopening to the public.

Reopening of the levees will be staged as the assessments and associated works are completed. It is expected levees will progressively start to reopen in 2-3 months.

The government levee banks are Cowirra, Neeta, Wall Flat, Pompoota, Mypolonga, Mobilong, Burdett, Long Flat, Monteith and Jervois.

### Recreational activities

Recreational activities are not permitted on the levees while they are closed, including:

- walking and running
- cycling
- fishing
- driving vehicles
- mooring houseboats and other vessels.

Designated council houseboat mooring sites can be obtained from the relevant local council website.

Access to private levees is at the landholder's discretion, however, access is not permitted where remediation works are being undertaken.

The safety of the public is of paramount importance and DEW will keep the community informed of the project's progress, including when levees may be accessible to the public, through its website and newsletter.

For more information, please visit [Department for Environment and Water – Levees](#)

If you have any questions, please contact Lisa van der Linde, Communications and Engagement Officer on 0437 313 087 or [Lisa.vanderlinde@sa.gov.au](mailto:Lisa.vanderlinde@sa.gov.au)
