WATER RESOURCES ASSESSMENTS FOR GROUNDWATER AND SURFACE WATER

Water resources monitoring and reporting in South Australia

Why are water resources assessments important for our state?

Our water resources provide critical human drinking water and deliver economic prosperity through agriculture, mining, industry and tourism. They also support social, cultural and recreational purposes including the irrigation of parks, gardens, school ovals and golf courses. Surface water and groundwater sustains creeks, streams, springs, lakes and wetlands that support critical plant and animal ecosystems. To manage our limited water resources sustainably for current and future water needs, we need to understand the quantity and quality of our surface water and groundwater systems. This will become even more critical given the projected impacts of climate change on South Australia.

The annual water resources reports use the information gathered by DEW's Water Resources Monitoring Unit and other data sources to deliver on DEW's Corporate Plan goals 'to help South Australians conserve, sustain and prosper':

CONSERVE: We work to conserve South Australia's natural resources, native species and natural places for their intrinsic value, and for people's benefit now and into the future.

SUSTAIN: We are an authority on environment, heritage and natural resources, helping community, industry, and government make good long-term decisions.

PROSPER: We guide the sustainable use of South Australia's natural resources and heritage, to deliver economic prosperity, health and wellbeing.

Who uses water resources data and annual water resources reports

- water licence holders and other rural and peri-urban landholders, industries including commercial irrigators, the mining industry and water suppliers such as SA Water to inform investment and planning decisions
- the South Australian public to better understand the state's water resources
- DEW and Landscape Boards including water resources managers, planners and scientists to inform technical investigations, management and planning decisions including the Water Security Statement, water allocation plans and their periodic reviews
- regional Landscapes staff to build a better understanding of groundwater and surface water systems and to assist in the prioritisation of Landscape Regions programs
- federal, state and local governments, particularly environmental agencies for State of the Environment reporting and water accounting
- researchers and water resources management consultants to inform research and investigations.

Water resources monitoring and reporting in 2020

DEW collected over 4800 measurements of groundwater level or salinity taken from about 1800 wells in prescribed areas

2053 GL of water extracted (2019-20) from the state's prescribed areas (1584 GL from surface water including the River Murray, 469 GL from groundwater)

114 gauging measurements of flow were collected from about 60 streamflow monitoring stations across the state. DEW collected two thirds of these

Groundwater and surface water data viewed from WaterConnect 60 000 times

Nearly 1100 salinity samples were submitted to DEW for analysis by licensees

Groundwater and surface water status reports viewed 1775 times

Annual water resources reports describe:

the hydrogeology and hydrology of the area

licensed water use and allocated volume

trends

streamflow volumes

surface water and groundwater salinity

Economic value of groundwater and surface water to South Australia

\$2.36 billion STATEWIDE

The estimated gross value of irrigated production to the state is \$1.9 billion STATEWIDE**

STATUS OF SOUTH AUSTRALIA'S PRESCRIBED WATER RESOURCES FOR 2011-2020

Status of South Australia's prescribed water resources

Prescribed surface water resources are assigned a status by expressing the annual flow of the prescribed area as a percentile of the total annual streamflow for the period of record. The overall status of the groundwater resource is assigned by ranking all the wells in the area from lowest to highest decile and selecting the median well as a description.

Note that evaluation of the sustainable limits of the resource, their management and monitoring occur separately through reviews of Water Allocation Plans (WAPs) and monitoring networks.

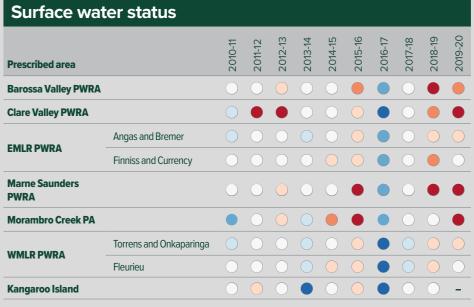

Decile	Percentile ¹	Streamflow/groundwater level ²	Colour
N/A	100	Highest on record	•
10	90 to 100	Very much above average	
8 and 9	70 to 90	Above average	
4, 5, 6, and 7	30 to 70	Average	0
2 and 3	10 to 30	Below average	<u> </u>
1	0 to 10	Very much below average	
N/A	0	Lowest on record	•

¹ The nth percentile of a set of data is the value at which n% of the data is below it. For example, if the 75th percentile annual flow is 100 ML, 75% of the years on record had annual flow of less than 100 ML. Median streamflow: 50% of the records were above this value and 50% below. Decile: a division of a ranked set of data into ten groups with an equal number of values. In this case e.g. the first decile contains those values below the 10th percentile.

² A description of the deciles and their descriptions can be found in Bureau of Meteorology Annual Climate Statement 2019

The surface water status is based on streamflow data collected for each water reporting year (i.e. July – June). This assessment excludes the River Murray as this is reported separately. The groundwater status is based on water level data collected for each calendar year (January – December).
