2013 SUMMARY

The Barossa Prescribed Water Resources Area (PWRA) encompasses both the highland areas of the Mount Lofty Ranges and the Barossa Valley, approximately 60 km north-east of Adelaide. It is a regional scale resource for which surface water and groundwater have been prescribed under South Australia’s Natural Resources Management Act 2004. A Water Allocation Plan provides for sustainable management of the groundwater resources.

Barossa PWRA consists of three major aquifers; two sedimentary aquifers (Upper and Lower), which are located within the valley and a Fractured Rock aquifer which outcrops in the ranges to the east and west of the valley and underlies the sedimentary aquifers. This report focuses on the Upper aquifer of the Barossa PWRA.

Groundwater flow within the Upper aquifer is in a south-westerly direction in the valley and to the north near Lyndoch. Recharge to the Upper aquifer of the Barossa PWRA originates from rainfall and streamflow in some areas. Seasonal responses to recharge are common, except where there is overlying Quaternary clay. Groundwater salinities are highly variable, from 960 to 12 000 mg/L. The majority of wells have salinities above 3000 mg/L. The more saline groundwater is observed in wells located in the northern extent of the aquifer.

Metered extractions from the Upper aquifer totalled 468 ML* for 2012–13, representing 14 % of the total extraction within the Barossa PWRA and is a 101 % increase in extraction from this aquifer when compared to the previous water-use year (Fig. 1). This volume of extraction equates to 7 % of the total groundwater allocation limit of 7147 ML for the Barossa PWRA.

The climate of the Barossa PWRA is characterised as Mediterranean with hot, dry, dry summers and cool, wet winters. Data from the Angaston rainfall station (number 23300) were chosen for analysis of rainfall in 2013 (Fig. 2). The long-term monthly average rainfall is graphed in orange against the total monthly rainfall recorded. In 2013, the monthly rainfall data indicates that significantly below average rainfall was evident in January, March, October and November, however well above average rainfall occurred in May and July. The total annual rainfall was 499 mm, slightly below the long-term (1889-2013) annual average of 535 mm.

Due to the slightly below average rainfall and double the volume of extractions in groundwater from the previous year, water levels in the Upper aquifer have declined in 68 % of the 31 observation wells with available data by up to 1.1 m when compared with the maximum water level observed in 2012 (Fig. 3). Despite the general regional decline in water level, eight wells observed an increase in maximum recovered water level of up to 0.38 m and one well showed no change in the maximum recovered water level when compared with 2012. The general regional decline is likely due to the increase in extraction from 2010-11 to 2011-12 and below average rainfall.

Groundwater salinity in the Upper aquifer is highly variable. Long-term salinity trends indicate that well MOR 273 has experienced significant variations in salinity (895 -5 109 mg/L) over the past 10 years whilst well NTP 11 has shown little variability. In 2013 salinity concentration in the monitoring wells ranged from 1 239 to 12 028 mg/L with the more saline groundwater found in the northern portion of the aquifer (Fig. 4). Nine out of eleven monitored wells have salinity values higher than 1500 mg/L, the tolerance level for grape vines. Eight of the eleven monitored wells show an increase in salinity when compared to October 2012 salinity values.

* The licensed groundwater use for the 2012–13 water-use year is based on the best data available as of March 2013 and may be subject to change, as some extraction volumes are in the process of being verified.
The Upper aquifer of the Barossa PWRA has been assigned a yellow status for 2013:

### 2013 STATUS

“Gradual adverse trends, indicating a low risk to the resource in the medium term”

This means that gradual adverse trends in resource status have been observed over the reporting period. Continuation of these trends is unlikely to negatively impact the beneficial use (may include drinking water, irrigation or stock watering) of the resource for at least 15 years. The 2013 status for Upper aquifer is supported by:

- an overall decrease in the maximum recovered water level in 2013 when compared to 2012 water level data
- an overall increase in salinity levels in 2013 when compared to 2012.

To view the *Barossa PWRA Groundwater Level and Salinity Status Report 2012*, which includes background information on hydrogeology, rainfall and relevant groundwater-dependent ecosystems, and to view the descriptions of all status symbols, please visit the *Water Resources* page on [WaterConnect](#).

For further details about the Barossa PWRA, please see the *Water Allocation Plan for the Barossa Prescribed Water Resources Area* on the Adelaide and Mt Lofty Ranges Natural Resources Management [website](#).

Figure 2. Monthly rainfall (mm) for 2013 and the long-term average monthly rainfall (mm) at the Angaston rainfall station (number 23300) in the Barossa Prescribed Water Resources Area

Rainfall data used in this report is sourced from the SILO Patched Point Dataset, which uses original Bureau of Meteorology daily rainfall measurements and is available online as www.longpaddock.qld.gov.au/silo.
Figure 3. Overall changes in maximum groundwater levels in the Upper aquifer of the Barossa Prescribed Water Resources Area from 2012 to 2013

The hydrographs displayed are examples of the Upper Aquifer’s groundwater levels over the last ten years. To find all available groundwater level information for wells in the Barossa PWRA, visit WaterConnect.
Groundwater salinity of the Upper aquifer in the Barossa Prescribed Water Resources Area for October 2013

Processes such as groundwater movement, sampling techniques and instrument error can cause variations in groundwater salinity measurements. Therefore, the collection of data over several years is required to establish any meaningful trends. The graphs displayed are examples of the Upper Aquifer’s salinity over the last ten years. To find all available salinity information for wells in the Barossa PWRA, visit WaterConnect.
