## VE23742 Bells Reserve Monitoring\_Letter

Mr Jai O'Toole  
Department of Environment, Water and Natural Resources  
(DEWNR)  
101 Grenfell Street  
Adelaide  
SA  
5000

17 December 2012

VE231232 / Bells Reserve, Monteith / Rev0

Dear Jai,

### **RIVERBANK COLLAPSE HAZARD, LOWER REACHES RIVER MURRAY STABILITY RISK MANAGEMENT, BELLS RESERVE, MONTEITH, MONITORING REVIEW – APRIL 2012 TO DECEMBER 2012**

#### **Introduction**

Sinclair Knight Merz (SKM) are pleased to provide the Department of Environment, Water and Natural Resources (DEWNR) with a review of ground survey monitoring data collected from the foreshore at Bells Reserve, Monteith in the lower reaches of the River Murray, South Australia.

Survey monitoring was carried out by Alexander & Symonds Pty Ltd (Alexander & Symonds) on behalf of DEWNR. Monitoring data collected consists of eight data sets (including the initial survey) between 16 April 2012 and 6 December 2012. The data on 16 April 2012 is taken as the baseline with minor variances on that date distributed across the survey as a whole. The aim of the monitoring was to measure vertical and lateral surface movements of fixed survey points installed adjacent to the river bank in order to monitor surface deformations along the foreshore at Bells Reserve over time.

The analysis has been conducted to allow efficiency in interpretation and ease of analysis for future survey monitoring rounds at the site.

The site plan indicating the location of the riverbank monitoring points is included as Figure 1.

#### **Brief Background**

Unprecedented low water level occurred in the Lower River Murray from 2008 to 2010 as a result of drought (Reference 1). Subsiding water levels has been a major contributing factor to a large number of riverbank cracking and collapse incidents along the River during this time.

A number of incidents were investigated in detail by DEWNR (previously the Department of Water, Land and Biodiversity Conservation (DWLBC)) to analyse the severity and public risk of potential riverbank instability.

On 30 March 2009, a 1000 m<sup>2</sup> area along riverbank at Bells Reserve was recorded on DEWNR's incident register to have subsided with extensive cracking noted adjacent upstream of the boat ramp. SKM conducted a site inspection on 23 September 2009 at which time the water level (in the vicinity of the boat ramp) was recorded at -0.715 m AHD (Reference 1). Extensive tension cracks 0.5 to 1 m wide and 1 m deep with water at their base were observed as well as signs of rotational slips upstream of the boat ramp. Tension cracks and bank failures were attributed to increased surcharge resulting from lowering water levels at that time.

The site was flagged as a critical site with high potential for bank failure to occur (at the time considered to pose a serious threat). Subsequently pedestrian and vehicle access was prevented by fencing off areas that had slipped and where cracking had occurred.

The risk of riverbank collapse has reduced with the recent post-drought recovery of river levels along the lower River Murray. The river level at the Long Island monitoring station (station ID A4261162) in Murray Bridge (approximately 5.5 km upstream of Bells Reserve) was reported at 0.835 m AHD on 11 December 2012 (Reference 2). A number of ground monitoring programs have been implemented by DEWNR to enable reassessment of the safety of areas previously classified as of high risk.

## Monitoring Programme

Ground survey monitoring of riverbank deformation at Bells Reserve was conducted by Alexander & Symonds between 16 April 2012 and 6 December 2012. Monthly monitoring data is presented in Appendix A.

The monitoring involved establishing three dimensional (Easting (E), Northing (N), Elevation(y)) co-ordinates using total station survey methods at a total of 68 reference points. Reference points consisted either of 'Y' section steel pins driven into the ground to a depth of 0.5 m or targets attached to buildings, Stobie poles, posts or tree stumps. Survey accuracy is reported to be within ±3 mm horizontally (E and N) and ±2 mm vertically (y). The accuracy has not been qualified where reference points are perceived as unstable (e.g. attached to submerged tree stumps).

The first survey (including 61 of the 68 survey points) was carried out on 16 April 2012 and has been used as the baseline survey from which relative movement was determined for the majority of the survey points. Three of the survey points (126, E1, F1) were installed on 6 September 2012 and an additional four survey points were installed on 4 October 2012 (D0, E2, F2, G2). The 6 September 2012 and 4 October 2012 surveys have been used as baseline surveys for these points, respectively.

Survey differences (movement) have been reported in millimetres (mm).

## Review and Analysis of Monitoring Data

Eight sets of monthly data collected between 16 April 2012 and 6 December 2012 have been reviewed. As indicated on Figure 1, the site was split into three sections for ease of analysis of river bank stability; Section 1 – Boat Ramp Area, Section 2 – Previously Slumped Area, and Section 3 – Wetland Area.

Section 1 is currently open to the public while Section 2 and Section 3 are fenced off to restrict public access to the river bank area.

The review and analysis of lateral and vertical movement at each monitoring point was conducted according to a set pattern, referred to hereafter as the *Preliminary Filter*. The Preliminary Filter consisted of the following tasks:

1. Establish the cumulative difference between the first and last surveys (positive or negative) for each of the three components (E, N, y) at each survey pin.
2. Highlight all points with a cumulative deformation of 5 mm or greater in any direction over the full monitoring period for further analysis.
3. Check that greater movement on a single axis on any individual survey did not exceed the value represented by the cumulative value. If cumulative movement was exceeded, consider this point for further analysis.

Five of the monitoring points (A3, C2, E1, F1 and P4) experienced vertical deformation greater than or equal to 5 mm. Three points (C1, E1 and F1) showed lateral movement greater than 5 mm. These points have been further analysed.

To gain a visual appreciation of the lateral and vertical deformation occurring across the site the monitoring data for 4 October 2012 (at which time all monitoring points had been installed) and 6 December 2012 (most recent monitoring survey) has been graphically presented as Figure 2 and Figure 3, respectively. Contours of vertical movement have been incorporated to identify local vertical deformation (heave and settlement) and vectors demonstrate the magnitude and direction of lateral movements.

### Section 1 – Boat Ramp Area

Analysis of this section centred on points with cumulative vertical and lateral deformation exceeding the 5 mm threshold.

Monitoring data for points A3 and C2 have shown cumulative changes in vertical elevation exceeding 5 mm. These changes are inferred as localised depressions as adjacent points show little to no discernible vertical movement above the survey accuracy of  $\pm 2$  mm. To

inspect the development of the vertical movements at these points over time, a plot of elevation against time is presented in Appendix B for both points.

Elevation data for A3 shows vertical movement within survey accuracy throughout the monitoring period, with the exception of a 4 mm settlement (compared to the baseline survey) which occurred between 30 July 2012 and 6 September 2012. Subsequent heave and settlement movements did not exceed survey accuracy, with the elevation currently at -5 mm compared to the baseline survey. This may indicate a single, localised event caused by interference with the monitoring target.

All vertical movement at C2 over the monitoring period has been within survey accuracy; however there has been a cumulative settlement of 5 mm since the baseline survey. Two incremental settlement events occurred between 16 April 2012 and July 2012, and 4 October 2012 and 6 December 2012. Settlement increments of 1 to 2 mm were recorded between subsequent monitoring events. It is noted that point C2 is adjacent to the boat ramp access path.

Contours of vertical elevation Figure 2 and Figure 3 illustrate the localised nature of both depressions in Section 1, and the slightly increased settlement over time between the October and December monitoring events for C2. The graph included in Appendix B further indicates that the timing of settlement between A3 and C2 did not coincide, and were likely caused by independent incidents.

Cumulative lateral movement of 7 mm Northward (resultant movement), towards the river, was recorded during the December monitoring round at C1 located adjacent to the boat ramp. The change in lateral position with time has been plotted and included in Appendix C. This indicates no dominant direction of movement over the total monitoring period. The last three monitoring periods have both shown movement towards the river (Westerly at 1 November 2012, Northerly at 4 October and 6 December 2012) however the October and November monitoring rounds indicated resultant movement of only 2 and 3 mm, respectively.

Lateral movement indicated by vectors shown on Figure 2 and Figure 3 further show only small lateral movements without an overriding dominant direction in October but a general riverwards trend in December (within survey tolerance). Lateral deformation in Section 1 may be influenced by survey tolerance and very minor shrinkage and swelling governed by localised ground material.

## Section 2 – Previously Slumped Area

Significant movement exceeding the 5 mm threshold was only observed in the submerged, riverside area of Section 2. All lateral and vertical deformation landside of the fence were within survey accuracy or cumulatively below 5 mm.

Survey points E1 and F1 (installed on 6 September 2012) both exhibited excessive lateral and vertical movement, however these targets have been installed on submerged tree stumps and

were noted by Alexander & Symonds as being unstable. Four additional monitoring points (D0, E2, F2 and G2) were installed on posts in the shallow water on 4 October 2012 and are considered to be more stable and representative of movements in this area.

Changes in elevation and lateral position with time are presented in Appendix B and Appendix C for both points. Only three rounds of monitoring have been carried out on these points to date. E1 has shown gradual heave amounting to 5 mm since being installed in September while F1 has subsided by 7 mm over the same time period.

E1 has shown horizontal movement of 21 mm in a Northerly direction (towards the river) while F1 has exhibited 18 mm of movement towards the North-East (away from the river). The time series data shown in Appendix C indicates that E1 has moved in the same direction over the past three monitoring periods, while F1 has varied in direction towards and away from the river.

Only two rounds of monitoring data are available for the additional monitoring points installed in October (with the exception of E2 which was not observed in the December monitoring due to access issues). Nonetheless horizontal and lateral movement recorded to date at these more stable monitoring points have been within survey accuracy or below the 5 mm threshold.

### **Section 3 – Wetlands Area**

This section of the riverbank demonstrated minimal lateral and vertical movement with only one point (P4) indicating local heave exceeding the 5 mm threshold over time. The change in elevation since the first monitoring period is included in Appendix B, and indicates gradual heave to a maximum of 6 mm recorded on 6 September 2012 with gradual settlement having occurred since then. Elevation is currently at 4 mm compared to the baseline survey.

This trend indicates possible seasonal variation, with heave and shrinkage occurring due to changes in moisture content affecting local (adjacent to monitoring point) ground conditions. Vertical movement of adjacent points indicate slight settlement within survey accuracy range.

### **Discussion and Conclusions**

Vertical movement recorded in Section 1 indicates two localised depressions of 5 mm compared to the baseline survey at points A3 and C2. Time series data indicates most movement was within survey accuracy range, with independent localised events causing subsidence. Given this section of the reserve is open to public access, these movements are most likely attributed to human interference, particularly at C2 located adjacent to the boat ramp access path. Overall the area shows very slow vertical subsidence, however this remains within survey accuracy and is therefore considered inconclusive.

Lateral deformation at Section 1 shows no overriding dominant direction of movement prior to December 2012 with only C1 showing resultant movement exceeding 5 mm towards the river. Overall lateral movements in this area appear to be very small and generally random, with the proximity of C1 to the boat ramp possibly affecting the variability in direction of movement over

time. Again while the area is starting to show slow movement towards the river, this remains within survey accuracy and is not conclusive at this point in time. ***Access restrictions are not considered necessary in this area.***

The monitoring data collected since 16 April 2012 has not indicated discernible movement on the landward side of the fence in Section 2. The negligible movement in this area suggest that access restrictions are not required. Data collected from recently installed monitoring targets in the submerged, slumped area are considered inconclusive due to the instability of two of the monitoring points showing significant movement and the small amount of data available for more stable targets at the time of this review. ***This area should remain fenced off such that near-shore access is prohibited.***

There has been no evidence of accelerated vertical or lateral movement riverside of the installed fence in Section 3 since monitoring commenced in April 2012. Slight heave and settlement, possibly caused by seasonal variations, has occurred over time at P4 located landside of the fence with no discernible movement detected along the northern boundary of the houses near the riverbank. ***There appears to be no justifiable reason to keep Section 3 fenced off from public access, although future quarterly monitoring (upon completion of the first 12 months of monthly monitoring) is recommended to track potential changes in deformation in the area.***

## **Recommendations**

Based on the review and analysis of eight sets of monitoring data collected at Bells Reserve, Monteith since 16 April 2012, the following recommendations are made for future monitoring and management of the site:

1. Continuous monthly survey monitoring cannot be justified based on the ground deformation trends recorded over the past eight months. It is recommended that the first monthly annual sequence is completed (up to, and including, April 2013). Thereafter, provided that the overall trends continue as they have been recorded in this review over the first year, monitoring frequency can be reduced to quarterly intervals over the course of 2013/14 (July 2013 to July 2014)) and a review and reassessment should be conducted after the next four (quarterly) measurements. Depending on the results of the July 2014 review it may be appropriate to move to bi-annual or annual surveys provided the river level remains within its normal range of approximately 0.25 m AHD to 1.75 m AHD as measured at the Long Island monitoring station in Murray Bridge (Reference 2, Figure 4).
2. On present indications:
  - No access restriction are required for Section 1
  - The previously slumped areas in Section 2 should remain fenced off with appropriate signage

- No access restrictions are required on the landward side of Section 2
- No access restrictions are required in Section 3

All of the above recommendations should be reviewed if survey monitoring shows unexpected adverse trends, or if new evidence of cracking or riverbank collapse is observed or if the river level falls below its normal range. River levels below 0.25 m AHD at the Long Island monitoring station in Murray Bridge should serve as a trigger point to review monitoring (Reference 2, Figure 4).

3. It is further recommended that during all future monitoring rounds the reduced level of the water is established and recorded with the monitoring results.

## Limitations

This review is based on the data provided by DEWNR from Alexander & Symonds. It is assumed that the data provided is a true indication of ground movement that has occurred at Bells Reserve, Monteith since 16 April 2012.

												Max	1	1	2	1	1	2
												Min	-1	-1	-2	-1	-1	-2
												Average	-0	0	-0	-0	0	-0

**Notes:**

Max, Min & Average values are for monitoring droppers only

Coordinates are calculated from least squares adjustment.

Chainage & offset is relative to line approximately parallel to river bank

Origin of Chainage & Offset Alignment: E 1 616.395, N 9 718.221

End of Chainage & Offset Alignment: E 1 556.687, N 9 940.384

Cross movement is positive away from the river bank in a south easterly direction

Upstream movement is positive in an upstream (north easterly) direction

Movement shown is relative to first survey 16 April 2012

Design co-ordinate accuracy is +/- 3mm

Design elevation accuracy is +/- 2mm

# BELL'S RESERVE - MONTEITH

## RIVER BANK MOVEMENT MONITORING

04-June-2012

Date of survey	4-Jun-12
Equipment	Set 89
Surveyed by:	NRG

References:  
 BELLS RESERVE  
 A&S: A078911.0006

											Max	1	1	2	1	1	2	
											Min	-1	-1	-2	-1	-1	-2	
											Average	-0	0	-0	-0	0	-0	

**Notes:**

Max, Min & Average values are for monitoring droppers only  
Coordinates are calculated from least squares adjustment.  
Chainage & offset is relative to line approximately parallel to river bank  
Origin of Chainage & Offset Alignment: E 765.768, N 1 901.403  
End of Chainage & Offset Alignment: E 1 003.130, N 2 084.867  
Cross movement is positive away from the river bank in a south easterly direction  
Upstream movement is positive in an upstream (north easterly) direction  
Movement shown is relative to first survey 16 April 2012  
Design co-ordinate accuracy is +/- 3mm  
Design elevation accuracy is +/- 2mm

## BELL'S RESERVE - MONTEITH

### RIVER BANK MOVEMENT MONITORING

03-July-2012

Date of survey	3-Jul-12
Equipment	Set 59
Surveyed by:	NRG

												Max	2	2	4	3	2	2
												Min	-2	-2	-3	-3	-3	-3
												Average	0	0	-1	1	0	-1

**Notes:**

Max, Min & Average values are for monitoring droppers only  
Coordinates are calculated from least squares adjustment.  
Chainage & offset is relative to line approximately parallel to river bank  
Origin of Chainage & Offset Alignment: E 765.768, N 1 901.403  
End of Chainage & Offset Alignment: E 1 003.130, N 2 084.867  
Cross movement is positive away from the river bank in a south easterly direction  
Upstream movement is positive in an upstream (north easterly) direction  
Movement shown is relative to first survey 16 April 2012  
Design co-ordinate accuracy is +/- 3mm  
Design elevation accuracy is +/- 2mm

											Max	2	3	6	1	3	2	
											Min	-2	-1	-3	-3	-2	-1	
											Average	0	1	-1	-0	1	1	

**Notes:**

Max, Min & Average values are for monitoring droppers only  
Coordinates are calculated from least squares adjustment.  
Chainage & offset is relative to line approximately parallel to river bank  
Origin of Chainage & Offset Alignment: E 765.768, N 1 901.403  
End of Chainage & Offset Alignment: E 1 003.130, N 2 084.867  
Cross movement is positive away from the river bank in a south easterly direction  
Upstream movement is positive in an upstream (north easterly) direction  
Movement shown is relative to first survey 16 April 2012  
Design co-ordinate accuracy is +/- 3mm  
Design elevation accuracy is +/- 2mm

# BELL'S RESERVE - MONTEITH

## RIVER BANK MOVEMENT MONITORING

06-September-2012

Date of survey	6-Sep-12
Equipment	Set 59
Surveyed by:	NRG

References:  
 BELLS RESERVE  
 A&S: A078911.0006

Max	2	2	6	1	1	2
Min	-3	-2	-5	-2	-3	-4
Average	-0	-0	-1	-0	-1	-0

**Notes:**

Max, Min & Average values are for monitoring droppers only  
Coordinates are calculated from least squares adjustment.  
Chainage & offset is relative to line approximately parallel to river bank  
Origin of Chainage & Offset Alignment: E 765.768, N 1 901.403  
End of Chainage & Offset Alignment: E 1 003.130, N 2 084.867  
Cross movement is positive away from the river bank in a south easterly direction  
Upstream movement is positive in an upstream (north easterly) direction  
Movement shown is relative to first survey 16 April 2012  
Design co-ordinate accuracy is +/- 3mm  
Design elevation accuracy is +/- 2mm  
**New control point 126 added**  
**New monitoring points E1 and F1 added on tree stumps in water**  
**Tree stumps are not very stable additional more stable points to be added**

6/09/2012

## BELL'S RESERVE - MONTEITH

### RIVER BANK MOVEMENT MONITORING

04-October-2012

Date of survey	4-Oct-12
Equipment	Set 59
Surveyed by:	NRG

References:  
 BELLS RESERVE  
 A&S: A078911.0006

Max	6	2	5	6	2	3
Min	-1	-8	-6	-1	-8	-3
Average	0	-0	-1	1	-0	-0

**Notes:**

Max, Min &amp; Average values are for monitoring droppers only

Coordinates are calculated from least squares adjustment.

Chainage &amp; offset is relative to line approximately parallel to river bank

Origin of Chainage &amp; Offset Alignment: E 765.768, N 1 901.403

End of Chainage &amp; Offset Alignment: E 1 003.130, N 2 084.867

Cross movement is positive away from the river bank in a south easterly direction

Upstream movement is positive in an upstream (north easterly) direction

Movement shown is relative to first survey 16 April 2012

Design co-ordinate accuracy is +/- 3mm

Design elevation accuracy is +/- 2mm

New control point 126 added

New monitoring points E1 and F1 added on tree stumps in water

Tree stumps are not very stable additional more stable points to be added

New monitoring points D0,E2, F2 and G2 added - targets on posts in shallow water

6/09/2012

4/10/2012

BELL'S RESERVE - MONTEITH  
RIVER BANK MOVEMENT MONITORING

01-November-2012

Date of survey	1-Nov-12
Equipment	Set 59
Surveyed by:	AJW

References:

Max	7
Min	-4
Average	0

**Notes:**

Max, Min & Average values are for monitoring droppers only  
Coordinates are calculated from least squares adjustment.  
Chainage & offset is relative to line approximately parallel to river bank  
Origin of Chainage & Offset Alignment: E 765.768, N 1 901.403  
End of Chainage & Offset Alignment: E 1 003.130, N 2 084.867  
Cross movement is positive away from the river bank in a south easterly direction  
Upstream movement is positive in an upstream (north easterly) direction  
Movement shown is relative to first survey 16 April 2012  
Design co-ordinate accuracy is +/- 3mm  
Design elevation accuracy is +/- 2mm  
**New control point 126 added**  
**New monitoring points E1 and F1 added on tree stumps in water**  
**Tree stumps are not very stable additional more stable points to be added**  
**New monitoring points D0,E2, F2 and G2 added - targets on posts in shallow water**

Max	15
Min	-4
Average	1

**Notes:**

Max, Min & Average values are for monitoring droppers only  
Coordinates are calculated from least squares adjustment.  
Chainage & offset is relative to line approximately parallel to river bank  
Origin of Chainage & Offset Alignment: E 765.768, N 1 901.403  
End of Chainage & Offset Alignment: E 1 003.130, N 2 084.867  
Cross movement is positive away from the river bank in a south easterly direction  
Upstream movement is positive in an upstream (north easterly) direction  
Movement shown is relative to first survey 16 April 2012  
Design co-ordinate accuracy is +/- 3mm  
Design elevation accuracy is +/- 2mm  
**New control point 126 added**  
**New monitoring points E1 and F1 added on tree stumps in water**  
**Tree stumps are not very stable additional more stable points to be added**  
**4/10/2012 New monitoring points D0,E2, F2 and G2 added - targets on posts in shallow water**  
**6/12/2012 101A, A4 & E2 not observed due grass/foliage growth**

6/09/2012

4/10/2012
