1.0 Introduction

1.1 Purpose

As part of the *Murray-Darling Basin Compliance Compact*, Basin states are required under Action 3.10 to provide public assurance over the quality and coverage of water information for compliance and enforcement, including from hydrometric networks and hydrologic models, by taking the following actions having regard to the Water Information Framework:

- (i) publish a review of its water information requirements to identify any gaps;
- (ii) publish a water information improvement program for addressing any priority issues including maintenance backlogs.

This report fulfils South Australia's obligations in respect of these requirements.

Under the MDBA's 'Water Information Quality Assurance Framework (Water Information Framework)', water information refers broadly to the range of water data that can be used to improve measurement and support compliance activities across the Basin. In this Framework, water information is grouped into:

- **Hydrometric networks** – provides directly measured data of surface water, groundwater, meteorology and water quality;
- **Hydrological modelling** – useful to estimate and report on unmetered actual take, permitted take, protection of environmental flows in unregulated river systems, accounting for use of e-water and system losses;
- **Remote sensing and other emerging technologies** – useful for the estimation of water held in floodplains, on farm water storage, interception, irrigated areas, environmental take, monitoring of environmental/flood flows.

As recognised in the Water Information Framework and the Compliance Compact, while metering of extractions is an important component of water measurement and compliance, work to improve metering arrangements is being progressed through a separate work program and therefore has not been included as 'water information' in this report.

1.2 Water information

Relevant water information that is used to improve measurement and to support compliance activities across the South Australian Murray-Darling Basin (having regard to this Water Information Framework) is sourced from:

- Surface water gauges and ancillary instrumentation;
- Groundwater bores;
- Climate (rainfall and evaporation) stations;
- Hydrological models (surface water and groundwater) used to estimate surface water flows and groundwater capacity;
- Remote sensing to estimate on-farm water storage.

1.3 Water monitoring arrangements and standards

The Department for Environment and Water (DEW) operates water monitoring sites in South Australia owned by both State Government and the Murray-Darling Basin Authority (MDBA). DEW maintains these assets and collects data from this network. Further, the MDBA provides funding for capital replacement and maintenance of sites that are owned by the MDBA. All data collection and analysis is done according to best management practice. The list below shows the standards that are used in relation to flow measurement and meteorology. All Australian Standards (with the prefix AS) are available on the Standards Australia website at www.standards.org.au. The National Industry Guidelines (with the prefix NI) and remaining state based technical procedures are available or are planned to be available at website www.environment.sa.gov.au/topics/water/monitoring/policies-and-guidelines.

Table 1: Measurement and meteorology standards used by DEW.

2.0 Hydrometric networks

In South Australia the hydrometric network comprises:

- 254 surface water gauges (including ancillary instrumentation); and
- 1449 active groundwater wells.

2.1 Surface water hydrometric network

A review of the surface water hydrometric network has been completed in the South Australian Murray-Darling Basin. There are 6 different site classifications for surface water gauges that are broadly categorised as follows:

Table 2: Surface water hydrometric network and the purpose of use

Site classification	Description	Number of sites
Baseline Surveillance	Regular observations to allow evaluation of the state and condition of a water resource and to inform knowledge of the long term baseline trend of the resource. Baseline surveillance sites are viewed as continuous, near permanent sites which provide information for assessing the health of a resource over time.	33
Compliance and Impact Surveillance	Regular observations of the response of a water resource to management actions that aim to ensure an equitable balance is achieved between environmental, social and economic needs for the water. Compliance and Impact sites are required for the duration of the associated management action however the location of sites may alter over time reflecting development and land use change.	23
Operational Surveillance	Surveillance conducted to support an organisation's business function. This monitoring may provide data to assist the organisation's management and decision making. Operational sites are required for the duration of the business functions that are supported by the sites' data.	149
Project Surveillance	Surveillance to allow an increased understanding of the spatial and temporal quantity and quality of a specific water resource, and the impacts of development on the water resource. Project surveillance may be focussed on achieving increased understanding to inform the sustainable level of use of a water resource, i.e. the development of a Water Allocation Plan. Project sites are required for the duration of the associated project.	42
Regulatory Surveillance	Surveillance conducted to meet an organisation's legislative obligations or development approval agreements. Regulatory sites are required for the duration of the organisation's obligations under relevant legislation or development approval agreements.	1
Emergency Preparedness Surveillance	Surveillance to provide forewarning of potential threats to;	6

	<ul style="list-style-type: none"> the water resource system - long term threats such as climate change and drought. infrastructure development and potential loss of life - short term immediate threats (i.e. flood monitoring) <p>Emergency preparedness surveillance supports an improved understanding of the threat so that appropriate mitigation measures can be implemented, e.g. flood warning and drought monitoring. Emergency preparedness surveillance sites are viewed as continuous, near permanent sites.</p>	
--	--	--

Appendix 1 shows the surface water gauges used in the Murray-Darling Basin prescribed water resources areas, their site classification and the broad ‘water information’ associated with them.

In accordance with the Water Information Framework, the 254 surface water sites have been classified into the following categories – measurement (or flow), water quality and meteorology. Table 3 shows how many sites are assigned to each category.

Table 3: Surface water hydrometric network classified according to MDBA Water Information Framework¹

Parameters monitored	Number of sites
Flow only	43
Water Quality only	13
Meteorology only	48
Water Quality and Flow	126
Flow and Meteorology	9
Water Quality and Meteorology	1
Flow and Water Quality and Meteorology	13
Unknown	1
TOTAL	254

An internal DEW review of the Murray-Darling Basin’s surface water monitoring network was completed in February 2020. The purpose of this review was to identify gaps in the monitoring network (i.e. requirements for upgrades and additional monitoring sites). The review included the following process:

- Reviewing the MDBA’s ‘Water Information Quality Assurance Framework’ and the requirements of the Murray-Darling Basin Compliance Compact to identify the scope of the review. It was identified that the review was to include the quality and coverage of the monitoring network that informs compliance and enforcement activities broadly. This includes the monitoring data requirements for water planning and management purposes, compliance and enforcement (noting that metering requirements are managed under separate Compliance Compact requirements), resource capacity, demand and environmental modelling and water quality monitoring (for water planning and management purposes);
- Identifying relevant stakeholders within DEW that are responsible for the purposes above to obtain advice on gaps or required improvements in the monitoring network. This included the relevant branches and groups within DEW;
- Consulting with those stakeholders to determine gaps or improvements; and
- Incorporating feedback into this report in table 4.

The outcomes of the review identified a number of gaps/improvements that are listed in table 4.

It is considered that one of the key uses of the hydrometric network for the purpose of compliance and enforcement is to model the capacity of the resource, set sustainable extraction limits and to inform demand. In relation to these matters, DEW notes that:

- South Australia has three accredited Water Resource Plans in place for the three Basin water resource plan areas of the State, including for the River Murray, the SA Murray Region and the Eastern Mount Lofty Ranges. The monitoring network has adequately provided the information necessary for the hydrological modelling required to comply with the water resource planning process; and
- In prescribed surface water areas of the South Australian Murray-Darling Basin (including the South Australian River Murray, Eastern Mount Lofty Ranges and Marne Saunders prescribed water resource areas), all licensed extraction is currently metered (with only very minor, low-risk take being exempt, as outlined in published meter implementation plans). Therefore, South Australia has very little reliance on the surface water hydrometric network to provide ‘modelled’ demand, as actual demand is metered and known.

Improvements

A number of gaps have been identified and improvements recommended to optimise the network and in particular, as part of specific project needs, which are outlined in table 4 below.

Table 4: Improvements to surface water hydrometric network

Site Name	Project	Description	Purpose	Approximate timing
Yet to be identified -	Healthy Coorong Healthy Basin Water Resource Optimisation Project (activity 4.2.3)	Installation of monitoring station for dissolved oxygen (sensors)	Water quality	2020
Yet to be identified -	Healthy Coorong Healthy Basin Water Resource Optimisation Project (activity 4.2.4)	Installation of monitoring station for temperature with depth on mudflats (sensors)	Water quality	2020
Yet to be identified -	Healthy Coorong Healthy Basin Water Resource Optimisation Project (activity 4.2.5)	Installation of monitoring station for turbidity (sensors)	Water quality	2020
Yet to be identified -	Healthy Coorong Healthy Basin Water Resource Optimisation Project (activity 4.2.6)	Installation of monitoring station for light (sensors)	Water quality	2020
Parnka Point	Healthy Coorong Healthy Basin Water Resource Optimisation Project (activity 4.3.3)	Installation of new meteorology station Rain/wind/evaporation near South Lagoon instrumentation	Meteorology	2020
Purchase and use of ‘mobile’ monitoring equipment	Healthy Coorong Healthy Basin Water Resource Optimisation Project (activity 4.2.1, 4.2.2 and 4.3.4)	Mobile equipment to monitor <ol style="list-style-type: none"> bathymetry around islands, bays, between North and South lagoons water movement between north and south lagoon and barrage flow gauging 	Measurement	2020

¹ Notwithstanding the above, it is acknowledged that the monitoring network will need to remain fit for purpose, and therefore as the primary information changes, the classification of sites may alter in response.

Site Name	Project	Description	Purpose	Approximate timing
Change from 3 to 4G network for all telemetered equipment	All sites	Required upgrades	All sites (measurement, water quality and meteorology)	2023
Upgrade to a new telemetry and logging system for locks on River Murray and Lower Lakes Barrages	Locks on River Murray and Lower Lakes	Old telemetry and logging system is no longer supported (for repairs) by manufacturer so needs upgrade to new system	Measurement and water quality	2022
Hogwash (A4260702)	Environmental watering programs including – weir manipulation; River Murray Channel watering actions; and the Integrated Operation of the Floodplain Regulators (at Chowilla; Pike and Katarapko)	New surface water monitoring site with logger	Water quality	2021
Sunlands (A4260594)	Environmental watering programs (as above)	Upgrade to existing monitoring site to monitor water quality	Water quality	2021
Overland Corner (A4260652)	Environmental watering programs (as above)	Upgrade to existing monitoring site to include a logger and to monitor water quality	Water quality	2021
Site near U/S L3 Cobdogla	Environmental watering programs (as above)	New monitoring station with logger	Water quality	2021
Site near Lake Bonney NW inlet	Environmental watering programs (as above)	New monitoring station with logger	Water quality	2021
Site near Barmera jetty historic site	Environmental watering programs (as above)	New monitoring station with logger	Water quality	2021
Site near A4261263	Environmental watering programs (as above)	New monitoring station with logger	Water quality	2021
Site near Lindsay Creek	Environmental watering programs (as above)	New monitoring station with logger	Water quality	2021
Pike - Tanyaca Creek Upstream Tanyaca Regulator	Pike Floodplain (SARFIIP)	New water quality monitoring station	Water quality	2020
Pike – Pike River Upstream Col-Col bank A4261053	Pike Floodplain (SARFIIP)	New water quality monitoring	Water quality and flow	2020
Katarapko – Eckerts Creek Northern Arms	Katarapko Floodplain (SARFIIP)	New water quality monitoring station	Water quality	2020
Katarapko - Splash Creek upstream of the Primary Regulator	Katarapko Floodplain (SARFIIP)	New monitoring station	Water quality and flow	2020
Katarapko - Carparks Lagoon upstream of the Outfall Primary A4261264 – not deployed	Katarapko Floodplain (SARFIIP)	Upgraded site to include water quality parameters	Water quality	2020
Main River channel – Berri Irrigation Pumping Station (IPS) A4260537	SARFIIP	Upgraded site to include water quality parameters	Water quality	2020
Main River channel – Downstream of Lyrup A4261278	SARFIIP	Upgraded site to include water quality parameters	Water quality	2020
Capital aquisiton of new monitoring vessel to cover River Murray and Lower Lakes and Coorong	State Water Monitoring Equipment Annual Program	State capital program to ensure appropriate equipment to meet the demands of water monitoring in Lakes, Estuaries and Rivers. \$135K	Flow, Water Quality	2020

In addition to the improvements outlined above, the surface water monitoring network is maintained to a high standard through a robust maintenance and replacement program. Maintenance is performed in accordance with project plans with separate annual maintenance plans developed for:

- State surface water and groundwater monitoring sites;
- Monitoring sites for specific project sites (i.e. Chowilla, SARFIIP, Salt Interception Schemes); and
- The Murray-Darling Basin Authority monitoring sites through the MDBA Capital Asset Replacement Program (this is a longer-term, rather than annual plan).

The maintenance program for monitoring sites performed by DEW ensures there is a high confidence in the data it collects, including a KPI to supply ongoing data with 95 percent success rate for all sites. Key features of the maintenance program include:

- The monitoring network is serviced by teams from both Berri and Adelaide to facilitate timely response when urgent maintenance is required.
- Timeframes for the rectification of malfunctions are:
 - Hydrometric data key stations – within 3 business days (subject to weather conditions);
 - Hydrometric data secondary stations – within 5 business days (subject to weather conditions);
- All sites are required to be maintained at every site visit (at least) at the following intervals:
 - Water quality sites – every 6-8 weeks;
 - Water level/flow sites – every 4 weeks for locks/barrages, every 8 weeks (or less) for other River Murray sites, every 12-16 weeks for other SAMDB sites;
 - Meteorological sites - every 8 weeks (or less) for other River Murray sites, every 12-16 weeks for other SAMDB sites;
- Each instrument type is allocated a recommended lifespan by the manufacturer – all instrumentation is replaced within or at the end of its expected life. This is adjusted depending on environmental conditions and likely degradation.
- In addition, operational improvements are always progressing - new technology is constantly being evaluated and deployed as appropriate.

In summary, the KPI's for the maintenance program, which ensure the monitoring network's ongoing accuracy and performance are as follows:

- Data confidence - to supply ongoing data with 95 percent success rate for all sites;
- Hydrometric data key stations malfunctions rectified within 3 business days;
- Hydrometric data secondary stations malfunctions rectified within 5 business days; and
- 80 percent of routine maintenance of sites completed to schedule.

In future, any further monitoring improvements in relation to coverage or quality (including site closures, addition of new sites and upgrades or improvements) will be driven by specific projects or water resource management/planning issues (i.e. drought, declining groundwater levels etc.) that identify a specific need for improvements or additional instrumentation.

2.2 Groundwater hydrometric network

A review of the groundwater hydrometric network has been completed in the South Australian Murray-Darling Basin. There are 1449 groundwater bores associated with measurement, water quality or meteorology. Table 5 shows the management area the bores are located within and what type of 'Water Information' these bores provide (in accordance with the MDBA Water Information Framework):

Table 5: Groundwater hydrometric network and corresponding water information category

Management area	Parameters monitored			Agency
	No. of water level sites	No. of water level & water quality sites	No. of water quality	
Angas Bremer PWA	69			DEW
Berri and Renmark Irrigation Areas	74			DEW
Chowilla Floodplain	72			DEW

Appendix 2 shows the groundwater bores used in the Murray-Darling Basin prescribed water resources areas.

An internal DEW review of the Murray-Darling Basin's groundwater monitoring network was completed in February 2020. The purpose of this review was to identify any gaps in the monitoring network (i.e. requirements for upgrades and additional monitoring sites). The review included the following process:

- Reviewing the MDBA's 'Water Information Quality Assurance Framework' and the requirements of the Murray-Darling Basin Compliance Compact to identify the scope of the review. It was identified that the review was to include the quality and coverage of the monitoring network that informs compliance and enforcement activities broadly. This includes the monitoring data requirements for water planning and management purposes, compliance and enforcement (noting that metering requirements are managed under separate Compliance Compact requirements), resource capacity, demand and environmental modelling and water quality monitoring (for water planning and management purposes);
- Identifying relevant stakeholders within DEW responsible for the purposes above to obtain advice on gaps or required improvements in the monitoring network. This included relevant branches and groups within DEW;
- Consulting with those stakeholders to determine gaps or improvements in the groundwater monitoring network;
- Incorporating feedback on these gaps and improvements into this report in the 'improvements' section below.

The outcomes of the review identified the gaps or improvements that are highlighted in the 'improvements' section below.

It is considered that one of the key uses of the hydrometric network for the purpose of compliance and enforcement is to model the capacity of the resource, set sustainable extraction limits and to inform demand. In relation to these matters, DEW notes that:

- South Australia has three accredited Water Resource Plans in place for the three Basin water resource plan areas of the State, including for the River Murray, the SA Murray Region and the Eastern Mount Lofty Ranges. The monitoring network has adequately provided the information necessary for the hydrogeological modelling required to comply with the water resource planning process; and
- It should also be noted that in prescribed groundwater areas of the South Australian Murray-Darling Basin (including the Eastern Mount Lofty Ranges, Marne Saunders, Mallee and Peake Roby Sherlock prescribed wells areas), all licensed extraction is currently metered (with only very minor, low-risk take being exempt, as outlined in published meter implementation plans). Therefore, South Australia has very little reliance on the groundwater hydrometric network to provide 'modelled' demand, as actual demand is metered and known.

Improvements

South Australia is committed to continuous improvement, monitoring responsiveness to changing requirements and to ensuring the integrity of the existing monitoring network. The planned improvements to the groundwater monitoring network are:

- Survey of wells within the network to establish a more robust AHD level for modelling purposes and assist with informing flood inundation data in the SARFIIP (South Australian Riverland Floodplains Integrated Infrastructure Program) region by 2020; and
- Telemetry on all bores will be upgraded from 3G to 4G by 2022.
- The Chowilla groundwater monitoring network has recently been reviewed and optimised with telemetry upgrades.

In addition to the improvements outlined above, the quality of the groundwater monitoring network is achieved through a robust maintenance and replacement program.

The maintenance program for monitoring sites performed by DEW ensures there is a high confidence in the data collected. Key features of the maintenance program include:

- All sites are maintained at every site visit (at least) which occurs either 6 monthly (project sites) or 12 monthly (other State sites).

- Each instrument type is allocated a recommended lifespan by the manufacturer – all instrumentation is replaced within or at the end of its expected life. This is adjusted depending on environmental conditions and likely degradation.
- Operational improvements are always progressing – new technology is constantly being evaluated and deployed as appropriate.

The KPI for maintenance of the groundwater monitoring network is 80 percent of routine maintenance of sites completed to schedule.

In future, monitoring improvements in relation to coverage or quality (including site closures, addition of new sites and upgrades or improvements) will be driven by specific projects or water resource management/planning issues (i.e. drought, declining groundwater levels etc.) that identify a specific need for improvements or additional instrumentation.

2.3 Other meteorology information

South Australia utilises climate data (i.e. rainfall and evaporation) from existing Bureau of Meteorology sites to inform water modelling, planning and management. Typically this is via the infilling and standardisation available from the SILO database. It is accepted nationally that climatic data from the Bureau of Meteorology is an appropriate ‘source of truth’ and provides a robust network for reliable analysis. It is therefore considered that an external review of the coverage and quality of the Bureau’s sites is not required.

The only DEW sites used to inform meteorology are those already listed in the surface water section against the meteorology purpose. The analysis of their adequacy and required improvements is already included in the sections above.

3.0 Hydrologic models

Numerical water models are housed in the DEW Science Model Warehouse, an ongoing data management service that maintains the integrity and accessibility of these assets. The models are discoverable at a public website (<https://www.waterconnect.sa.gov.au/Systems/Models/SitePages/Home.aspx>). This includes links to the model reports and metadata. Only those models relating to surface water and groundwater that are used for Basin Plan implementation, specifically estimating take, environmental flows and system losses (per the Water Information Framework) are included in this report. Water Resource Plans are in place for the three water resource plan areas of the State, including for the River Murray, the SA Murray Region and the Eastern Mount Lofty Ranges. In section 10 of these Plans, South Australia has clearly documented the surface water and groundwater models used and their methodologies. The Murray-Darling Basin Authority has determined that all models are accredited and accepted. This review and accreditation process is publicly documented and demonstrates that the models used by South Australia are fit for purpose.

Further information on surface and groundwater models is provided in the sections below, which includes a review of current models and details on improvements.

3.1 Surface water models

There are 27 surface water models used in the SA Murray-Darling Basin.

Notwithstanding the accreditation of the surface water models through the water resource planning process, DEW has undertaken its own review of surface water models to ensure they are fit for purpose, to determine if there are any gaps in model coverage or to determine if any improvements or modifications are required.

The 27 surface water models and the purposes they relate to are detailed in Table 7. The ‘description of improvements’ column includes the outcomes of the review process and whether or not any improvements are required to the model, or whether it has been identified that a new model is required, and when the work is planned.

Table 6: Summary of surface water models used in the SA Murray-Darling Basin – River Murray

Model No.	Software	Custodian	Name	Type	Extent	Purpose/application	Status	Description of improvements
1	Source	MDBA ¹	Source Murray Model	Hydrological - Flow routing	Murray-Darling Basin	Resource Assessment, planning, compliance, operations. Used by South Australia for s71 ⁷ reporting and policy assessment including Critical Human Water Needs and deferral and delivery from the SA Storage Right.	Active – Independently reviewed and determined to be fit for purpose.	Ongoing improvements to functionality and extension of key inputs for application to a range of Basin Plan compliance and operational requirements.
2	Source	DEW ² – SW ³ Team	SA ⁴ Murray	Hydrological - Flow routing	SA ⁴ River Murray – border to barrages	Long term and annual environmental water planning and actions, operations/scenario modelling	Active – Calibrated and reviewed by the MDBA ¹ . Fit for purpose.	Ongoing improvements to functionality related to water quality and operational requirements.
3	MSM BigMod	MDBA ¹	MSM-BigMod	Fortran code system model	Murray-Darling Basin	Resource Assessment	Active – Historic Basin model being superseded by Source Murray Model	No longer actively developed aside from occasional development testing by MDBA.
4	MIKE FLOOD	DEW ² – SW ³ Team	Lock 3 - Lock 6	2D Hydraulic – inundation extent	SA ⁴ River Murray – Lock 3 – Lock 6	Structure design, operations/scenario modelling including constraints management	Active – Calibrated and externally reviewed	Ongoing as necessitated by project demands and updated input data
5	MIKE FLOOD	DEW ² – SW ³ Team	Lock 1 – Lock 3	2D Hydraulic – inundation extent	SA ⁴ River Murray – Lock 1 – Lock 3	Structure design, and operations/scenario modelling including constraints management	Active – Calibrated and externally reviewed	Ongoing as necessitated by project demands and updated input data
6	MIKE FLOOD	DEW ² – SW ³ Team	Lock 1 – Wellington	2D Hydraulic – inundation extent	SA ⁴ River Murray – Lock 1 - Wellington	Operations/scenario modelling including constraints management	Active – Calibrated and externally reviewed	Ongoing as necessitated by project demands and updated input data
7	MIKE 11	DEW ² – SW ³ Team	Gurra Gurra Wetland	1D Hydraulic – inundation extent	SA ⁴ River Murray – Gurra Gurra Wetland	Long term operations/scenario modelling	Active – Calibrated and used for specific project use	None planned, fit for purpose
8	MIKE FLOOD	DEW ² – SW ³ Team	Gurra Gurra Wetland	2D Hydraulic – inundation extent	SA ⁴ River Murray – Gurra Gurra Wetland	Detailed structure design and operations/scenario modelling	Active - For specific project use	None planned, fit for purpose
9	MIKE FLOOD	DEW ² – SW ³ Team	Lake Bonney/Loch Luna	2D Hydraulic – inundation extent	SA ⁴ River Murray – Lake Bonney/Loch Luna	Structure design and operations/scenario modelling	Active – Calibrated and used for specific project use	Ongoing as necessitated by project demands and updated input data
10	MIKE FLOOD	MDBA ¹	Chowilla FM	2D Hydraulic – inundation extent	SA ⁴ River Murray – Chowilla Icon Site	Operations/scenario modelling	Active – Calibrated and maintained by MDBA ¹	Ongoing as necessitated by project demands and updated input data
11	MIKE FLOOD	MDBA ¹	Chowilla Grid	2D Hydraulic – inundation extent	SA ⁴ River Murray – Chowilla Icon Site	Operations/scenario modelling	Active – Calibrated and maintained by MDBA ¹	Ongoing as necessitated by project demands and updated input data
12	HEC-RAS	DEW ² - SW ³ Team	Bookmark Creek	1D Hydraulic	SA ⁴ River Murray – Bookmark Creek	Assess structure modifications and operations/scenario modelling	Active – For specific project use	None planned, fit for purpose
13	TUFLOW FV	DEW ² – SW ³ Team	CLLMM ⁵ TUFLOW FV	Hydrodynamic	Lock 1 to Coorong	Long-term and annual environmental water planning and actions, operations/scenario modelling	Active – For specific project use	As required by specific projects
14	CHM	CSIRO	Coorong 1D Hydrodynamic Model	Fortran code	Coorong and Murray Mouth	Long-term and annual environmental water planning and actions, operations/scenario modelling	Active – Calibrated and maintained by CSIRO	As required by specific projects

Matter 8 – Basin Plan – achievement of environmental outcomes at an asset scale 10. WAP – Water Allocation Plan

In addition to the improvements outlined in tables 7 and 8, DEW has undertaken a review to ensure consistency with the National Hydrological Modelling Strategy, which identifies Source as the National Hydrological Modelling Platform. As part of this, DEW has identified that the seven WaterCress models currently accredited for Basin Plan reporting should be migrated to calibrated rainfall-runoff Source models. This timeline will be dictated by project partner requirements and the availability of funding. An interim step to migrate five of these WaterCress models to flow routing models in Source is currently in progress for specific project use relating to low flow environmental release modelling.

Similarly, other Source models listed in Tables 7 and 8 above, which are deemed fit for purpose, will also be subject to improvements as necessitated by specific projects in line with this Strategy.

Currently, there are no new models planned to be created beyond those listed in these tables.

It should also be noted that of a total 254 surface water gauges in the South Australian hydrometric network, 116 are directly used as model inputs and for model calibration and validation. These sites, their modelling purpose and the models they relate to are listed in Appendix 2. The current hydrometric network is considered robust and fit for purpose for application to surface water models and any expansion or alteration of the existing network would be due to specific project demands. Examples of this are given in **Table 4: Improvements to surface water hydrometric network**.

3.2 Groundwater models

There are currently 11 active groundwater models in the SA Murray-Darling Basin (Figure 1). Completed groundwater models for the State are stored in the WaterConnect Model Warehouse. The models are discoverable at a public website (<https://www.waterconnect.sa.gov.au/Systems/Models/SitePages/Home.aspx>). This includes links to the model reports and metadata.

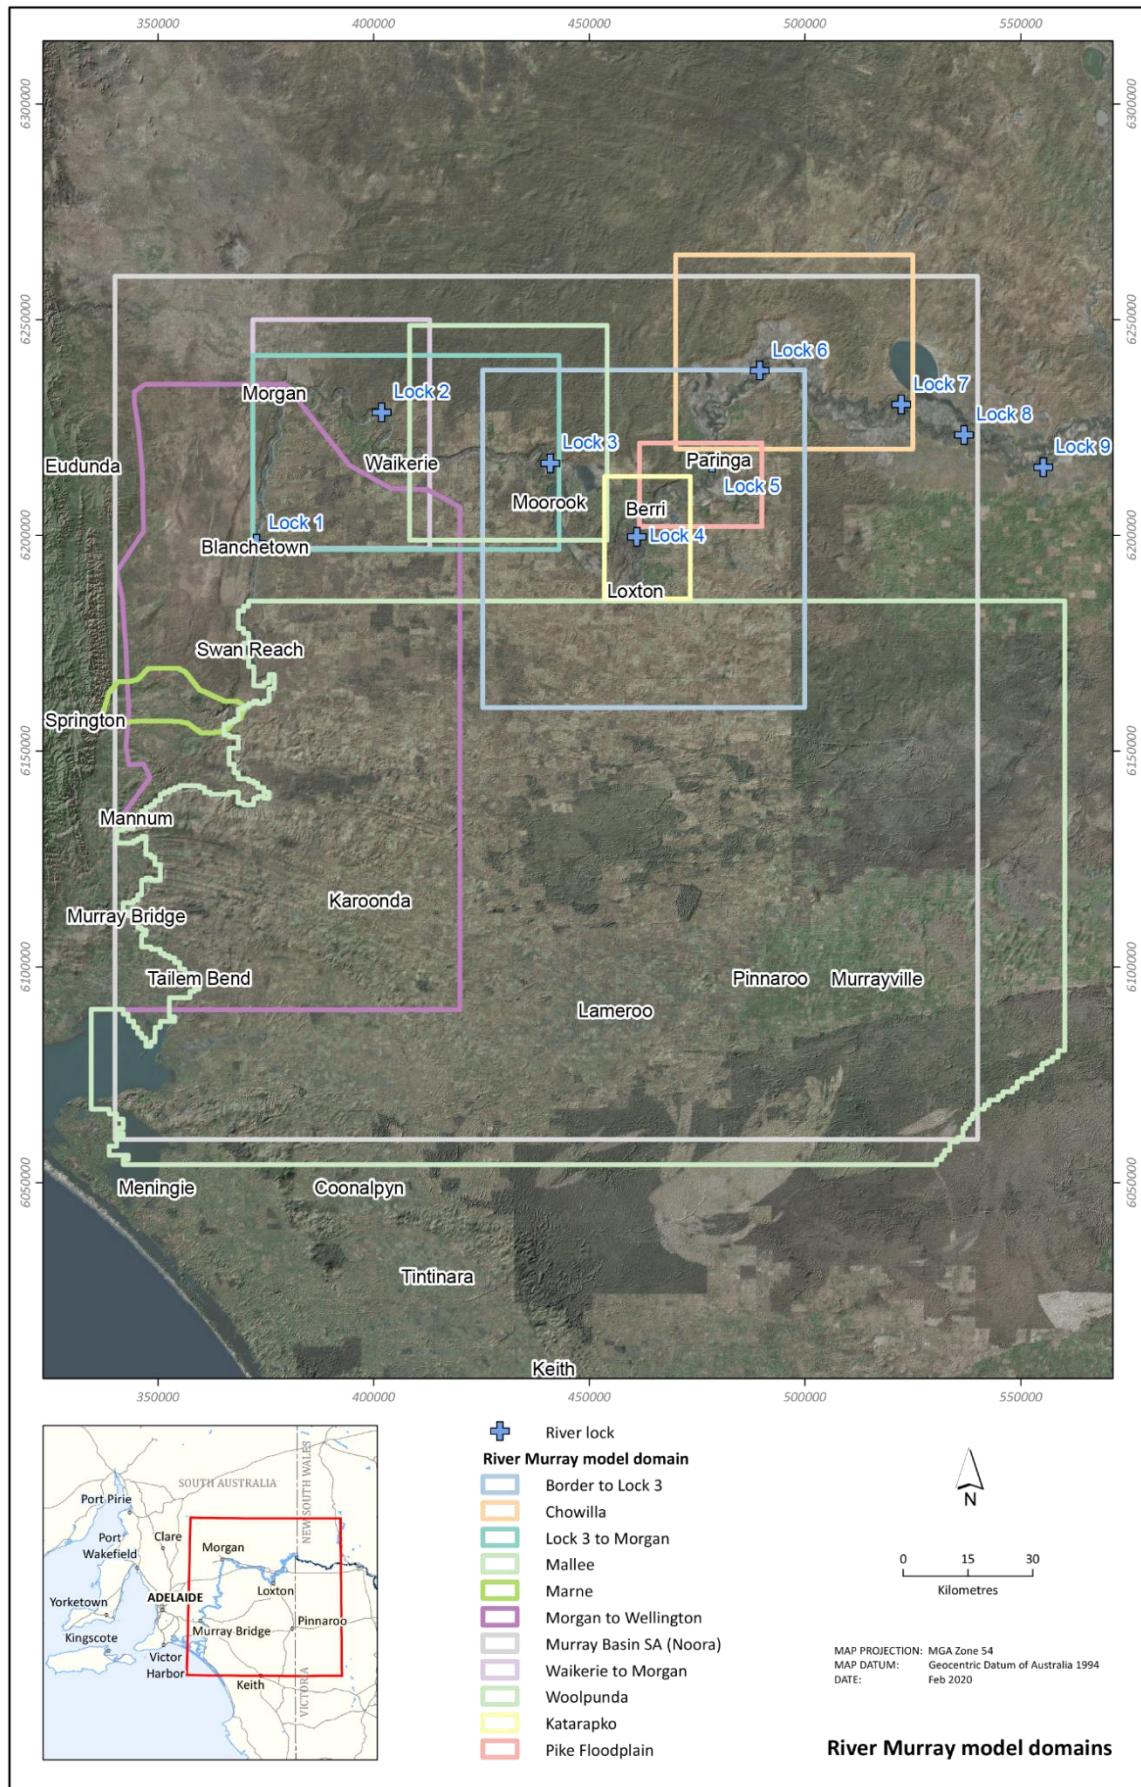

Figure 1: Active groundwater models in the South Australian Murray-Darling Basin region

In accordance with the Basin Salinity Management 2030 (BSM2030) strategy partner governments must review and report on salinity register entries and groundwater models, consistent with the principle of continuous improvement. A key focus for the BSM2030 strategy is to streamline mature processes, including by adopting a risk-based approach for the frequency of register entry and model reviews.

The BSM2030 review plan:

- (a) sets out the frequency of reviews required of each register entry and model, with a maximum review period of ten years with provision for more frequent reviews commensurate with risk and uncertainty, and allows for the grouping of register entries and associated models
- (b) includes the review of outcomes at End of Valley Target (EoVT) sites
- (c) enables partner governments and the MDBA to make pragmatic decisions to focus limited resources on the most significant salinity threats or where there is likely to be significant change or uncertainty
- (d) includes a 10-year outlook to provide partner governments with a basis for estimating budgetary and resourcing requirements to inform business and longer term planning.

Table 8: BSM2030- Model review plan for South Australian groundwater models

Register entries, models and outcomes at EoVT sites	Last review date	Review frequency (years)	Original review date	Proposed Review Date	Lead agencies	Rationale
Loxton - Bookpurnong model	2013	5	2019	2019	SA	
Pike-Murtho model	2018	5	2022	2022	SA	
Woolpunda model	2018	5	2023	2023	SA	
Waikerie - Morgan model	2018	5	2024	2024	SA	
Berri to Renmark	2010	5	2021	2020	SA	Update to 3rd generation model and agreed assumptions in 2017-18, with a major upgrade to 4th generation model in 2020.
Pyap to Kingston (including New Residence and Moorook)	2010	7	2021	2020	SA	Update to 3rd generation model and agreed assumptions in 2017-18, with a major upgrade to 4th generation model in 2020.
Morgan to Wellington	2010	10	2020	2021	SA/MDBA	Delayed until 2021 to prioritise Berri to Renmark and Pyap to Kingston model and accountable action reviews.
SA outcome at EoVT sites	-	Once prior to 2026	2025	2025	MDBA/SA	

Since this schedule was developed the following has occurred:

- The Pike-Murtho model has been reviewed and accredited MDBA Ref: D19/37160.
- The Loxton-Bookpurnong model has been reviewed by the Basin Salinity Management Advisory Panel (Basin Salinity Management Advisory panel, meeting 45, 19 February 2020).
- The review of the Berri-Renmark and Pyap to Kingston model has commenced.

- A major review of the Modelling Procedures is nearing completion, as led by the MDBA with input from jurisdictions including SA.
- Knowledge Priorities have been identified by the MDBA and jurisdictions, and a program of works is underway to address them. This has included a trial of a “transfer function” for estimating groundwater recharge under irrigated areas in the Loxton-Bookpurnong model.

It has also been identified that there are four groundwater models in the SA Murray-Darling Basin that are under development. These models and the purposes they relate to are detailed in the table below:

Table 9: List of improvements to groundwater models

Model	Purpose of model	Timeframe for completion[^]
Loxton Bookpurnong 2019 Groundwater Model	The aim of this model is to evaluate salt loads resulting from local, accountable actions such as land clearance, irrigation area development, changes in irrigation practice and the construction of salt interception schemes (SIS). The model was recently reviewed by an independent groundwater modelling expert and accredited by the MDBA. The model results may be used to calculate new Salinity Register entries for the Loxton to Bookpurnong area.	2020
Berri-Renmark Pyap to Kingston 2020 Groundwater Model	The aim of this model is to evaluate salt loads resulting from local, accountable actions such as land clearance, irrigation area development, changes in irrigation practice and the construction of salt interception schemes (SIS). After the model has been reviewed by an independent groundwater modelling expert and accredited by the MDBA, the model results may be used to calculate new Salinity Register entries for the Berri-Renmark Pyap-Kingston area.	2020-21 financial year
Pike Floodplain Groundwater Model	The aim of this model is to evaluate the impact of accountable actions associated with environmental watering and the management of groundwater within Pike Floodplain. Environmental watering as an accountable action, is consider as a series of management actions over the benchmark period (1975 to 2000). After the model has been reviewed by an independent groundwater modelling expert and accredited by the MDBA, the model results may be used to calculate new Salinity Register entries for the Pike Floodplain area. The model also informs operational planning, as it estimates groundwater impacts to floodplain vegetation health, and to Pike River salinity for irrigation.	2020 – 21 financial year
Katarapko Floodplain Groundwater Model	The aim of this model is to evaluate the impact of accountable actions associated with environmental watering and the management of groundwater within Katarapko Floodplain. Environmental watering as an accountable action, is consider as a series of management actions over the benchmark period (1975 to 2000). After the model has been reviewed by an independent groundwater modelling expert and accredited by the MDBA, the model results may be used to calculate new Salinity Register entries for the Katarapko Floodplain area.	2020 – 21 financial year

[^] Note that completion here is defined as provision of all relevant documents to the MDBA for accreditation purposes. Actual accreditation may take significantly longer if further information is sought by the MDBA or partner governments.

Current groundwater models use all available groundwater level data, including historic and decommissioned bore data. Data is also sourced from SA Water groundwater sites, including data from salt interceptions schemes.

The BSM2030 strategy also commits the MDBA and partner governments to nominate key salinity monitoring sites for inclusion in the Basin-wide core salinity monitoring network (the monitoring network). The monitoring network will be maintained for the life of BSM2030 and will be reviewed at least every 5 years to ensure the network continues to provide a sound basis for salinity assessment in response to an improved knowledge of risk and uncertainty.

To date the DEW has nominated 435 groundwater wells as part of the Basin-wide core monitoring network which includes regional and floodplain groundwater monitoring. A further 475 groundwater bores that are monitored to support the Salt Interception Scheme program have been nominated by SA Water as the State Constructing Authority on behalf of the joint venture.

4.0 Remote sensing

With reference to the Water Information Framework, remote sensing was used to initially establish and now continually update a coverage of farm dams and waterbodies in the following prescribed areas of the South Australian Murray-Darling Basin:

- The Eastern Mount Lofty Ranges Prescribed Water Resources Area; and
- The Marne Saunders Prescribed Water Resources Area.

Using aerial photography to determine the full supply surface area of each surface water asset, volume is estimated via surface area to volume relationships. A coverage of farms dams allows for an estimate of unmetered take from non-licensed dams (such as stock and domestic dams) and management of the resource in line with sustainable diversion limits, as outlined in the Water Allocation Plan for each prescribed area.

Along the River Murray, Sentinel satellite imagery is used for calibration and verification of the MIKE models, particularly to verify flood peak simulations during model development and to identify any improvements required to the model bathymetry files. Satellite imagery has also been used to provide observational data for analysis of model outputs, for example, identifying flow thresholds at which inundation commences in specific areas of South Australian River Murray floodplains.

4.1 Remote sensing review

As higher resolution imagery becomes available, it enables the continual refinement of full supply surface area capture of surface water assets and intern farm dam volume estimation. DEW has undertaken a review of the data and tools used to estimate farm dam capacity and determined the information is sufficiently ‘fit for purpose’ and best available at this point in time.

Under the Copernicus Earth observation program operated by the European Union, the Sentinel satellites collect comprehensive and continuous imagery made available to the public at no charge. Sentinel satellite imagery is accessed via the Sentinel Hub Sentinel Playground (<https://apps.sentinel-hub.com/sentinel-playground/>), an online platform operated by Sinergise, a specialist GIS IT company. The platform processes Sentinel, Landsat and other observation imagery for use in a range of applications. This data source is considered fit for purpose for the calibration and verification of the MIKE hydraulic models maintained and developed by DEW.
